

Sales Performance Analysis — Key Findings

Executive Summary

This analysis evaluates sales performance, profitability, customer segments, and product-level trends using the Superstore dataset. The dashboard identifies major revenue drivers, loss-making products, and factors affecting profitability. The findings provide business recommendations to improve margins, pricing strategies, and decision-making.

Key Insights

1. Regional Sales & Profit Performance: The West region generates the highest sales revenue, but profitability varies due to product mix, pricing decisions, and discount strategies.
2. Loss-Making Sub-Categories: Tables and Bookcases generate negative profit despite sales contribution, indicating pricing and cost issues.
3. Discount Strategy Impact: Higher discounts reduce profit margins and create loss-making transactions, especially in low-margin categories.
4. Seasonal Sales Trends: Monthly and yearly patterns show changing demand, helping improve inventory and promotion planning.

Business Recommendations

1. The company should reduce discounts above 30% in low-margin categories because excessive discounts consistently reduce profitability.
2. Review pricing and supplier costs for loss-making products such as Tables and Bookcases to improve margins.
3. Focus on profitable customer segments and categories with targeted promotions instead of broad discounting.
